### ***DBP Chronic Perinatal Study-Rats***

- a: Each dose was compared to the control with Shirley's test when a trend was present ( $P < .01$  from Jonckheere's trend test), or with Dunn's test when no trend was present [ $*$  =  $P < 0.05$ ,  $**$  =  $P < 0.01$ ]
- b: Results shown as mean  $\pm$  standard error [number of litters] unless otherwise noted.
- c: Litters where the male/female pup counts were inconsistent between PND 1 and PND 4 were excluded from the male/female-specific endpoints.
- d:  $100 \times (\text{Number of live males in dose group}) / (\text{Number of live males and females in dose group})$  [Number of pups]
- e: No statistics were performed on this endpoint.
- f: There was one non-sexed dead pup on PND1 in the 1000 ppm group.
- g: PND 1-4 litter size, dead, and survival endpoints do not include litters where the pup count increased from PND 1 to PND 4
- h:  $(\text{Number alive on PND 4 precull}) / (\text{Number alive on PND 1})$
- i:  $(\text{Number alive on PND 21}) / (\text{Number alive on PND 4 postcull})$
- j: Number of dead pups in dose [Number of litters]
